

**Usability: I would give myself 95%**

My goal for the website was to make it very simplistic and very easy to use, this was accomplished with a fixed navigation bar that clearly indicates what happens when you click the tabs, it has a clearly indicated active tab (indicated with the blue color).

The website has a to-top button which brings the user to the top of the page.

The website has clearly indicated links.

- There is a known bug where the link to chat.openai.com doesn't work because html thinks its a file

**Educational Value: I would give myself 100%**

Because my main persona was a user who was unfamiliar with ChatGPT I wanted to make the website fairly entry-level and easy to understand while still providing quality and accurate information. I did this by splitting the tabs into groups of information that are easy to follow and build off of each other without overwhelming the user with information. I simplified some of the topics but at the bottom of the page left links to references if the user wanted to read more in-depth about the information. Overall, because my persona was a user who knew nothing, this website is perfect for giving them that basic level of information.

**Interactivity: I would give myself 75%, not a lot of complex interactivity with my website, I instead prioritized usability**

I made a "to top" button on the lower right corner of the screen whenever the user scrolls to make it easy for the user to return to the top of the screen, I made sure to give this button a border so it's easily noticeable. If you hover over the button it changes your cursor to a pointer cursor as well as changes the color of the button.

I made an easy-to-read and easy-to-navigate navigation bar across the top that stays at the top of the screen even when scrolling (fixed), along with bars in between tabs, color changing tabs to indicate which tab you are currently on, as well as a different shade of (lighter) brown to indicate if you are hovering over the tab, the cursor also changes to a pointer cursor.

I implemented links both within the text that are clearly visible due to it being a different color as well as a clearly indicated link that is an image that brings you to a youtube video on a separate tab for further education.

**Aesthetics: I would give myself 100%**

I chose a light blue, dark brown, and cream color combo that complements each other and is easy on the eyes of the reader.

I also gave all images borders so as to not have the webpage be so harsh.

I chose the entire website to have a Sans-Serif font family to also make the website easy and readable to users.

I chose images to complement not only the content of the website but also the colors and general feel so as to not be in contrast.

Images and an image slideshow were added to aid the aesthetic of the website.

P.S. I'm sorry for not making it to the presentation day, I was in the hospital for sun poisoning.
